

Creating a Webpage

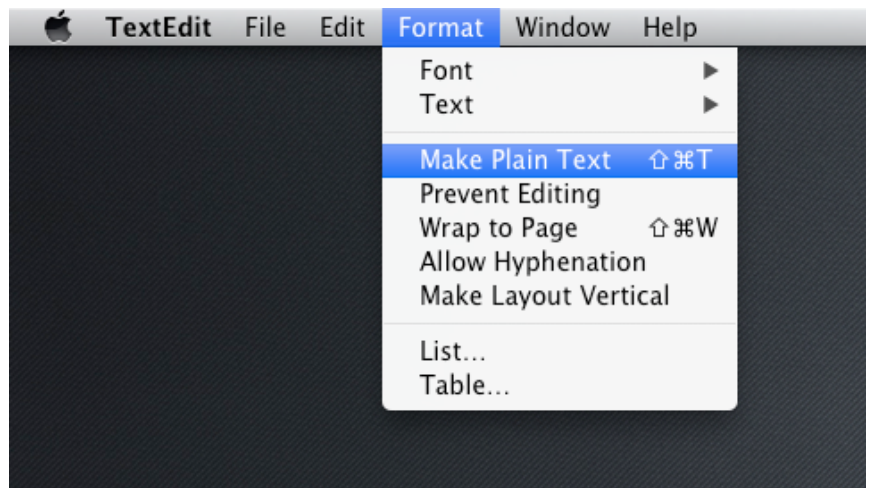

1) Launch TextEdit – To launch **TextEdit**, click on the magnifying glass on the upper right corner of the screen and type **TextEdit**. Click on **TextEdit** with your mouse or hit enter.

2) You should see something like this.

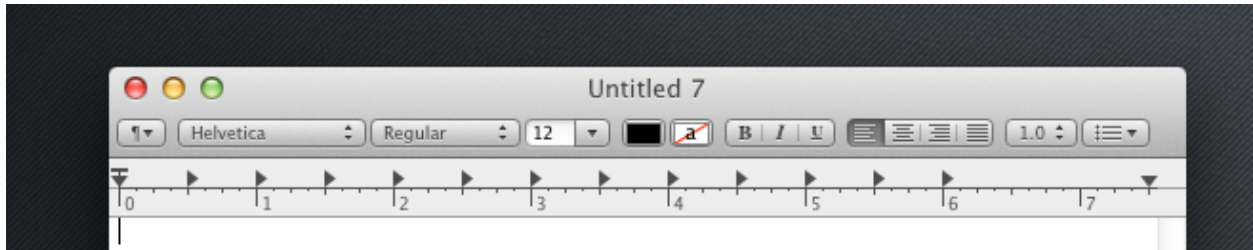

3) Changing to plain text - the first thing we are going to do is change this to **Plain Text**. To do this, click on **Format** on the toolbar and click on **Make Plain Text**.

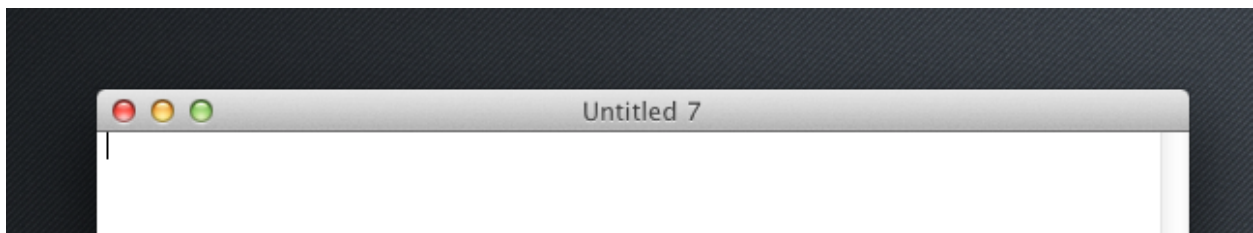

4) If you did this correctly, the toolbar in TextEdit should vanish.

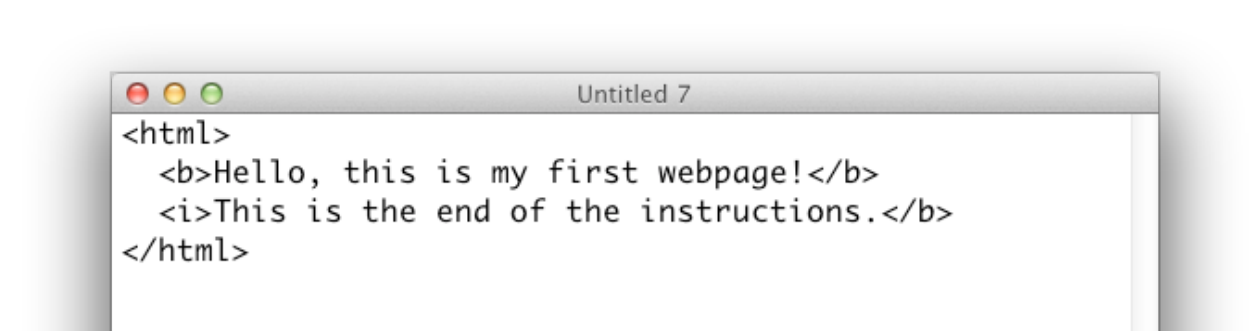

Before (Wrong)

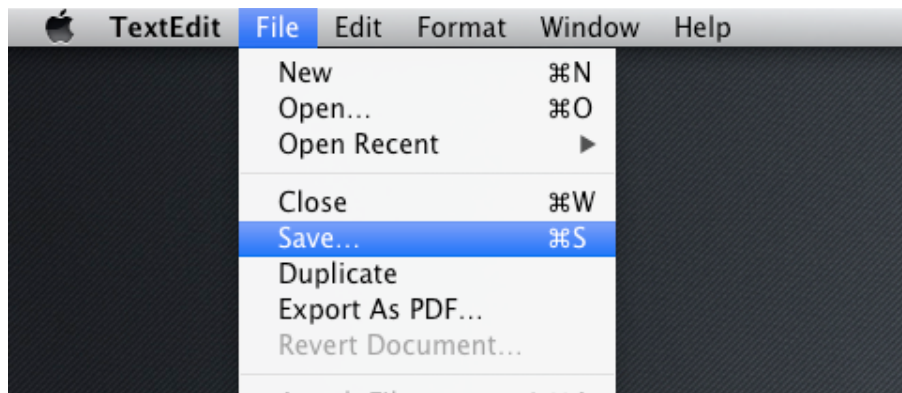

After (Correct)

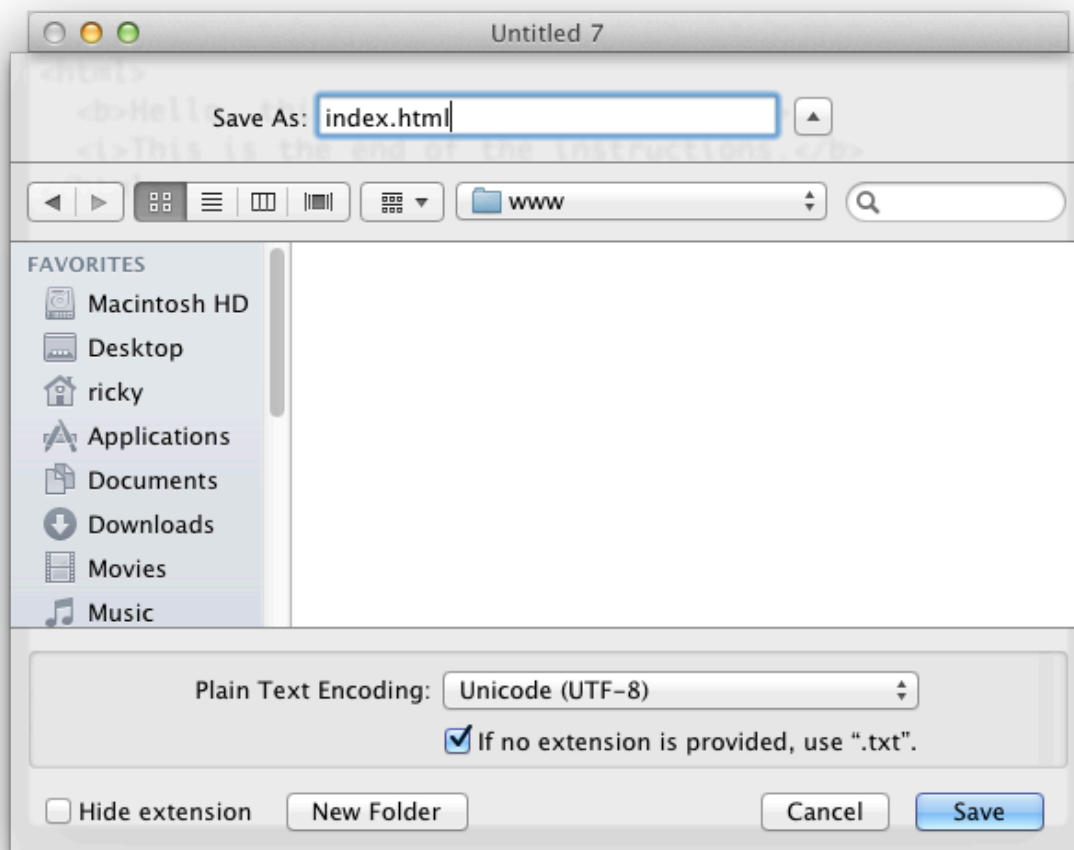

5) Now we can start coding!

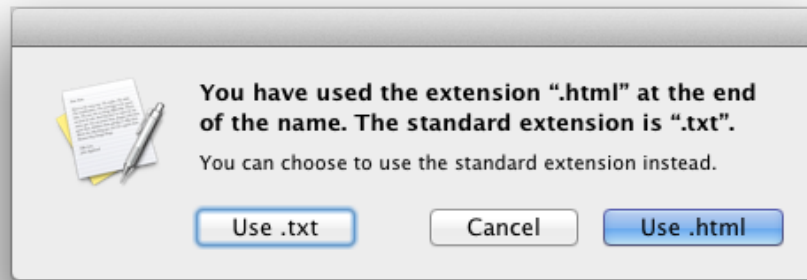

6) Now that we have some code, let's save the file. To save, go to **File >> Save**

7) A dialog similar to the one below should pop up. You can name it whatever you want, but we will name it **index.html**. Make sure whatever you decide to name it, that it **ends with an html extension**. We are saving the file in **~/Desktop/www**, but you can save it anywhere, just make sure you can find it later.

8) Click save. A dialog similar to the one below will pop up. Make sure you click the **Use .html** button.

9) That's it! Your file should be saved =). If you decide to make more changes to the file, just go to **File >> Save** and the file will be saved.
